### **ROUND ROBIN CPU SCHEDULING ALGORITHM**

```
Round Robin Scheduling
Process Burst Time Waiting Time Turnaround Time
P0 2 0 2
P1 6 5 11
P2 4 8 12
Average Waiting Time: 4.33333
Average Turnaround Time: 8.33333

Process exited after 2.121 seconds with return value 0
Press any key to continue . . .
```

### Conclusion;

Among the scheduling algorithms, **Shortest Job Next (SJN)** provides the best performance with the lowest Average Waiting Time (AWT) and Average Turnaround Time (ATAT), making it ideal for systems prioritizing quick task completion. **First-Come-First-Serve (FCFS)** is straightforward but can lead to longer waiting times for larger tasks. **Priority Scheduling** is effective for prioritizing critical processes but may increase waiting time for lower-priority tasks. **Round Robin (RR)** ensures fairness and responsiveness in time-shared systems but has slightly higher overhead due to frequent context switching. The choice of the algorithm depends on the system's specific requirements for fairness, efficiency, and priority handling.
